

Problem – Solution Fit

Date	31 July 2026
Project Name	Indoor Gardening Services Management (IGSM)
Platform	ServiceNow

Purpose

The Problem–Solution Fit for the IGSM application identifies the key operational challenges faced by indoor gardening service providers and demonstrates how the ServiceNow-based solution addresses those challenges through workflow automation, SLA tracking, technician assignment, and secure request management.

Problem–Solution Fit Canvas

Problem	Current Situation	IGSM Solution
Manual service request handling	Requests are received through phone calls, messages, or manual records, causing delays and inconsistent tracking.	Customers submit requests through the Service Catalog and Record Producer, creating structured digital requests.
Unorganized maintenance scheduling	Plant maintenance visits are scheduled manually and often require repeated follow-ups.	Maintenance schedules are managed through the IGSM request table with automated workflow support.
Delayed technician assignment	Technicians are assigned manually, leading to uneven workload distribution and slow response times.	Flow Designer automatically assigns technicians based on predefined business logic and availability.
Lack of approval transparency	Managers have limited visibility into pending service requests and approval status.	Automated approval workflows notify managers and track approval decisions within the application.
Missed SLA commitments	Response and completion times are difficult to monitor and enforce consistently.	Response SLA and Completion SLA monitor request timelines and trigger alerts for SLA breaches.
Limited service visibility	Customers cannot easily track the progress of their service requests.	Real-time status updates and notifications keep customers informed throughout the request lifecycle.
Weak access control	Sensitive request data may be accessible to unauthorized users.	ACLs provide role-based and requester-based access control for secure data management.
Poor operational monitoring	Managers lack centralized reporting on service performance and technician productivity.	Reports and dashboards provide service trends, SLA compliance, and technician performance metrics.

Value Proposition

The IGSM application transforms indoor gardening service operations from a manual process into a centralized ServiceNow solution that automates service requests, approvals, technician assignment, SLA monitoring, security, and reporting. This

improves operational efficiency, service reliability, and customer satisfaction while reducing administrative effort.
